

Stock Evaluation:

This project is related to stock analysis. It will focus on Google, Facebook, Amazon, Apple, Netflix (FAANG) and TESLA. It includes past 12 years stock analysis. Basically, it generates reports on how they perform during those periods. On the basis of that, we can also plan for the future to decide the stock growth. This whole procedure will perform in azure data factory using pipeline, SSIS and orchestration functionality.

First of all, we will create a table called `stocks_Evaluation_Stage`. In that, I will import data from the excel file using excel file. Then we will also have the target table called `Stocks_Evaluation_target`.

Second, we will apply the incremental load using the week2 assignment stored procedure in azure data lake.

For that, we also include the data model, if needed.

We will also try to accomplish metadata driven refresh and temporal database concepts, if time allows.

From the interface perspective, we will use azure data factory and we will use the features according to the requirements.

At the end, we will demonstrate the data using powerbi dashboard. It will include stock analysis, stock growth and live stock reports.
